

# INFECTIONS IN KIDNEY TRANSPLANT RECIPIENTS : SINGLE CENTER EXPERIENCE FROM TERTIARY CARE CENTER IN SOUTH INDIA

H HARITHA ,KISHAN A ,MYTHRI SHANKAR, RANJITHA S, VISWAS T, GOURI SATISH,  
ADITYA SHETTY H, GIREESH G REDDY ,SRAVANI VENU ,SHREEDHARA C G

## INTRODUCTION

- Infections occurring in the post transplant period are the major cause of morbidity and mortality in renal transplant recipients.
- Early infections (within the first month) are more likely to be due to nosocomially acquired pathogens, surgical issues, and some donor-derived infections.
- Opportunistic pathogens occur later after 6 months, reflects the greater impact of immunosuppressive therapies.
- Late infections may be secondary to opportunistic pathogens or conventional ones.

## METHOD

- Retrospective observational study.
- Patients admitted with infections between November 2019 to march 2022 excluding covid 19 were studied.
- Infections were categorised based on time line of infection into less than one month, 1-6 months and more than 6 months.
- Further sub categorised based on type of organisms and source of infection.
- Baseline characteristics, microbiological evidence, radiological findings were studied.
- Complications including graft dysfunction and need for various supports such as O2, ionotropes, ventilator and dialysis and treatment details and in hospital patient outcomes were analysed.

## RESULTS

- 53 patients were included in the study.
- Mean age of the study population was 35.2 years.
- 88.67% were males and 11.33% females .
- 66.03 % underwent live related renal transplant.
- 22.64 % of the study population had post transplant diabetes mellitus.
- There were 118 events of infection identified during the study period.
- Urosepsis being the the most common post-transplant infection, occurred in 36.44 % of total events followed by pneumonia in 19.49%
- There were 13 events of infection in the first month ,48 events in the period of 1 to 6 months and 57 events of infections after 6 months
- Most common organism isolated in patients with Urosepsis was Escherichia coli.
- 95.76% events were associated allograft dysfunction.
- In 15.25 % of events, patients had septic shock at presentation. Amongst them 44.44% had urosepsis, 33.33% had pneumonia, 22.22% had acute gastroenteritis.
- Among the patients who got admitted 18.86% expired during hospital stay,amongst them 60% had pneumonia and 30% had urosepsis and 10% had acute gastroenteritis.

| BASELINE CHARACTERISTIC OF PATIENTS (N=53) |             |
|--|-------------|
| AGE - MEAN                                 | 35.2 yrs    |
| SEX - MALE- N(%)                           | 47 (88.67)  |
| LIVE TRANSPLANT - N (%)                    | 35 (66.03)  |
| PTDM - N (%)                               | 12 (22.64)  |
| IN HOSPITAL MORTALITY - N (%)              | 10 (18.86)  |
| BASELINE CHARACTERISTIC (IN 118 EVENTS)    |             |
| DIALYSIS REQUIREMENT - N (%)               | 9 (7.62)    |
| O2 SUPPORT - N (%)                         | 18 (15.25)  |
| VENTILATORY SUPPORT - N (%)                | 8 (6.77)    |
| IONOTROPES - N (%)                         | 18 (15.25)  |
| ALLOGRAFT DYSFUNCTION - N (%)              | 113 (95.76) |
| MEAN HOSPITAL DAYS                         | 23.2 DAYS   |

| EVENTS                 | TOTAL EVENTS (118) | LESS THAN ONE MONTH(13) | ONE MONTH TO 6 MONTH(48) | MORE THAN 6 MONTHS (57) |
|------------------------|--------------------|-------------------------|--------------------------|-------------------------|
| UROSEPSIS              | 43                 | 7                       | 18                       | 18                      |
| PNEUMOMIA              | 23                 | 3                       | 9                        | 11                      |
| HEPATITIS B            | 1                  | 1                       |                          |                         |
| HERPES LABIALIS        | 1                  | 1                       |                          |                         |

## CONCLUSIONS

- Patients who undergo renal transplantation are subjected to immunosuppression which increase the burden of infections in the post-transplant period .Early and accurate diagnosis is the key to prevent morbidity and mortality of renal transplant recipients .
