

Pregnancy among women on chronic dialysis in a French National Cohort

Methods

Cohort

French ESKD
REIN Registry

National Health
Database

15-50 years

2006-2020

Results

Median at
conception:
32 years

240 women
348 pregnancies

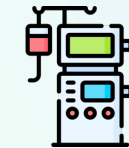

Rate:
11.1/1000
woman-year

Outcomes

50% deliveries
(95% live births)

In center HD the
most frequent
modality of RRT

50% abortions
(<22 weeks)
30% elective

3° trimester
151 pregnancies
55% daily HD

5.4%
Preeclampsia
1.4%
Polyhydramnios

Deliver probability
Parity, conception
before dialysis, daily
HD

Conclusion: Better fertility management of women on chronic dialysis is advised by contraception or by pregnancy planning and early multidisciplinary follow-up.
