## Cumulative Effects of the Aldosterone Synthase Inhibitor Vicadrostat Combined with Empagliflozin on Albuminuria in People with CKD

Cumulative effects of vicadrostat + empagliflozin on UACR

vs vicadrostat alone, empagliflozin alone, and placebo (PBO).

Vicadrostat<sub>PBO</sub> + empagliflozin<sub>PBO</sub>

**Conclusion:** Larger UACR reductions across all doses of vicadrostat were achieved in participants with CKD who received both active components (vicadrostat + empagliflozin) compared to treatment with either vicadrostat or empagliflozin alone, suggesting additive effects of the combination on UACR reduction.
